 [amirsohil.github.io](https://github.com/amirsohil)

 Colombo, Sri Lanka (Open to remote and international roles)

SUMMARY

Senior Software Engineer specialising in Analytics Engineering and Applied Data Science with 4+ years building production-grade intelligence systems for enterprise environments. Sole analytics owner for a UK-based Microsoft Dynamics 365 SaaS provider, delivering 200+ reports across 7+ production workspaces and reducing dashboard delivery cycles by up to 75% through scalable data modelling and development practices. Expertise spans Power BI, Microsoft Fabric, Python, Databricks, machine learning, and graph-based intelligence systems, with a focus on transforming complex operational data into decision-ready systems for executive and business users. First Class Honours Gold Medal graduate from Coventry University (4.0 GPA) and four-time international data competition award recipient.

EXPERIENCE

Senior Software Engineer - Analytics and Data Science (August 2025 - Present)

1 Billion Technology

- Sole analytics owner for a UK-based Microsoft Dynamics 365 SaaS provider, scoping, modelling, and deploying the full analytics suite serving enterprise clients, translating high-level business discussions into production-ready analytical systems without a formal requirements process.
- Architected and delivered analytical products across sales, operations, finance, and customer success functions, providing stakeholders with a unified analytics hub for operational KPIs, survey intelligence, and ISV product performance used for day-to-day and executive decision-making.
- Replaced manual executive reporting workflows with near-real-time Power BI dashboards, defining KPI frameworks, metric hierarchies, and reporting standards, significantly reducing reporting overhead and enabling faster business decision cycles.
- Evaluated and piloted Databricks AI/BI Genie as a conversational analytics layer over enterprise datasets, demonstrating natural-language business data exploration capabilities.
- Designed AI-assisted narrative reporting proof-of-concepts using Power BI Copilot, improving the relevance and usability of generated analytical commentary through iterative prompt and context engineering.
- Partnered on technology evaluation and adoption for the analytics practice, assessing and integrating Microsoft Fabric Lakehouse, Databricks, and Fabric AI capabilities into both client delivery workflows and internal engineering standards.

Engineer - Analytics and Data Science (April 2024 - July 2025)

1 Billion Technology

- Reduced dashboard delivery cycles from 1-2 weeks to under 2 days through reusable semantic modelling patterns, standardised Figma design system, DAX optimisation, and streamlined development workflows, significantly improving development efficiency and stakeholder turnaround time.
- Delivered 200+ production Power BI reports across 7+ project workspaces, supporting hundreds of end users across multiple client organisations and enabling consistent enterprise reporting across business functions.
- Designed and implemented a reusable Figma-based analytics design system adopted across client projects, standardising UI components, layouts, and visual hierarchy, improving consistency, development speed, and stakeholder adoption of solutions.
- Designed and optimised enterprise semantic data models across concurrent client engagements, improving query performance, scalability, and cross-report consistency, and establishing reusable modelling patterns adopted across the team.
- Designed and delivered an internal HR analytics platform for executive leadership covering workforce planning, recruitment pipelines, account structures, and project allocation, which was later commercialised by the company as the foundation of a standalone HR SaaS product.
- Delivered executive-level business performance reporting solutions for a GCC-based tech-enabled Employer of Record (EOR) and business consultancy firm, consolidating operational and commercial metrics into unified leadership dashboards, replacing fragmented manual reporting processes and improving executive visibility.
- Applied NLP-based text similarity techniques to unstructured client requirement data, enabling identification and grouping of semantically related requirements across different categories to support downstream analysis and reporting use cases.
- Contributed to Microsoft Fabric and Databricks (PySpark) data engineering initiatives by developing Bronze and Silver layer transformations within a medallion architecture, supporting downstream semantic modelling and enterprise reporting layers.

External Consultant (Client Facing) (March 2023 - March 2024)

1 Billion Technology

- Operated as the primary external-facing analytics consultant for the organisation, independently managing the full end-to-end analytics lifecycle across concurrent client engagements from discovery and scoping through to production deployment.
- Led stakeholder discovery and requirements definition sessions directly with client leadership, translating ambiguous business objectives into structured analytics requirements, semantic model designs, and phased delivery plans without dedicated product or business analysis support.
- Established organisation-wide analytics engineering standards covering Power BI architecture, semantic modelling conventions, DAX patterns, and visualisations, adopted as the default delivery framework across client projects.
- Delivered scalable semantic data models and Power BI reporting suites across multiple concurrent client engagements, enabling executive and operational decision-making across enterprise stakeholders and ensuring consistent reporting.

Intern Software Engineer - Data Analytics (April 2022 - February 2023)

1 Billion Technology

- Developed Power BI proof-of-concepts and production reports, built multi-source data models, and contributed to SQL Server stored procedure and view design.

TECHNICAL SKILLS

- Analytics Engineering & BI:** Power BI, DAX, Microsoft Fabric (Lakehouse, Pipelines, Semantic Models), Tableau, Plotly, Dash
- Applied Data Science & Machine Learning:** Python, scikit-learn, XGBoost, LightGBM, SHAP, statsmodels, SciPy, pandas, NumPy, polars, NLTK
- Data Engineering & Cloud:** Databricks (PySpark), Microsoft Azure, Azure DevOps, SQL Server
- Graph & Semantic Analytics:** Neo4j (AuraDB, Desktop), Cypher, Graph Data Modelling
- Visual Design & Collaboration:** Figma, Git, GitHub, Git LFS
- Applied AI Analytics:** Power BI Copilot, Databricks AI/BI Genie

EDUCATION

BSc (Hons) Data Science, First Class Honours | Coventry University, UK | 2024

GPA: 4.0/4.0 | Gold Medal (Best Overall Performance) | Dean's List

Dissertation: Multi-model ML classification system with SHAP explainability to identify elite footballers and generate season-wise best XIs, benchmarked against FIFA Team of the Season across Europe's top five leagues.

Higher National Diploma in Data Science | National Institute of Business Management, Sri Lanka | 2022

GPA: 4.0/4.0 | Distinction | Gold Medal (Best Overall Performance)

Advanced Diploma in Data Science | National Institute of Business Management, Sri Lanka | 2021

GPA: 4.0/4.0 | Distinction | Gold Medal (Best Overall Performance)

AWARDS & COMPETITIVE RECOGNITION

- Winner** – DataDNA Credit Risk Analytics Challenge | [Nova Credit Risk Lab](#) | September 2025
- Runner-Up** – DataDNA Dataset Challenge | [Washington's Woes](#) | March 2025
- Winner** – DataDNA “The Storyteller” Award | [The Tragic Times](#) | October 2022 | Special category recognising excellence in creative data storytelling
- Runner-Up** – DataDNA Dataset Challenge | [The Wonderful World of Pokémon](#) | July 2022
- 3× Gold Medal Recipient for Academic Excellence** | Coventry University & NIBM | Achieved a 4.0 GPA across BSc (Hons), Higher National Diploma, and Advanced Diploma qualifications

SELECTED PROJECTS

- Pola – Kapruka's Virtual Market** - Designed and built a 3D toon-shaded virtual marketplace in Three.js featuring seven distinct AI shopkeeper personas, backed by a FastAPI service with a multi-provider LLM fallback chain (Gemini → Cerebras → Groq) and live Model Context Protocol (MCP) tool calls against Kapruka's commerce API for real-time inventory and pricing actions.
- Transferium Player Intelligence** - Designed and deployed a graph-database-powered football player replacement engine using Neo4j AuraDB, computing 276,075 weighted cosine similarity relationships across 18,000+ players from Europe's top leagues to surface statistically comparable transfer targets through an interactive Streamlit application.
- Nova Credit Risk Lab** - Built an end-to-end credit risk analytics system using XGBoost across 32,581 real-world loans, developing a custom risk-tiering framework and delivering a five-page interactive Tableau dashboard for analytical and executive reporting. Winner, DataDNA Credit Risk Analytics Challenge (Sept 2025), an international analytics competition judged by industry professionals.
- Washington's Woes** - Conducted geospatial crime pattern analysis across Washington D.C., combining spatial clustering and temporal trend analysis to surface actionable public safety insights. Runner-Up, DataDNA Challenge (March 2025), recognised for analytical depth and visual communication quality.
- Elite Footballer Selection via ML + SHAP (BSc Dissertation)** - Built a multi-model machine learning system to identify elite footballers and generate season-wise best XIs across Europe's top five leagues, integrating SHAP-based explainability to surface the performance characteristics driving player selection decisions
